

Exercise 7

Users, Roles and Permissions — Zoho Creator

Hotel Room Booking & Front Office Management

This practical guide shows how to configure users, roles, and permissions for the existing hotel-booking application.

Note: No Exercise 7 question sheet was attached in this turn, so this PDF is a standard implementation guide for the stated topic, using the same Hotel Room Booking application context from your previous exercises. It is not a transcription of an unseen Exercise 7 sheet.

1. Real Zoho Creator Interface Examples

These are real Zoho Creator interface examples from the working project context. Use them to recognize the application/editing environment before opening the Users/Roles/Permissions settings.

Example 1 — Zoho Creator application area

The exact menu position can vary with the current Creator UI and account permissions.

Example 2 — Report/application area

Your permission settings should ultimately control what each user can see or modify in the Hotel Room Booking application.

2. User, Role and Permission — Basic Idea

User: an individual who accesses the Zoho Creator application.

Role: a group/category used to organize users according to their responsibility, such as Manager or Front Office.

Permission: the access granted to a user/role for application components and actions, such as viewing, adding, editing, or deleting records.

Simple hierarchy: User → Role → Access permissions → Forms/Reports/Pages/Actions

For the Hotel Room Booking application, the useful operational roles are **Manager, Front Office, Housekeeping, Finance, and Marketing**. Guests can be treated as external/public form users where the application design permits it.

3. Suggested Role Structure for the Hotel App

Role	Main responsibility	Typical access
Manager	Overall hotel booking control	View/manage booking data; monitor reports; manage operational settings
Front Office	Bookings and guest handling	Add/view/edit bookings; update operational statuses; use booking reports
Housekeeping	Room readiness and housekeeping	View relevant bookings; update housekeeping status
Finance	Payments and billing	View booking/payment information; update finance-related records
Marketing	Guest-origin and customer analysis	View map/summary/analytics reports; limited record editing

This table is an implementation example for the hotel application; use your faculty's Exercise 7 requirements if they specify different role names or permissions.

4. Create / Manage Users

1. Open the Hotel Room Booking application in Zoho Creator.
2. Open the application's user/security or user-management area available in your Creator account.
3. Add the required users or invite the users who need access to the application.
4. Enter the user's name/email and assign the appropriate role.
5. Save the user configuration.
6. Repeat for Manager, Front Office, Housekeeping, Finance, and Marketing users as required by your lab.

Testing tip: Keep at least one test account for each role so you can verify that permissions actually work.

5. Create Roles

1. Open the application's role/security settings.
2. Choose the option to create a new role.
3. Create the **Manager** role.
4. Create the **Front Office** role.
5. Create the **Housekeeping** role.
6. Create the **Finance** role.
7. Create the **Marketing** role.
8. Save the role definitions and assign users to the appropriate role.

The exact menu labels can differ by Creator edition/UI version. The important part is that the users are organized into the roles required by your Exercise 7 design.

6. Configure Form Permissions

1. Open the permissions/access settings for **Room_Booking_Form**.
2. For **Front Office**, allow the actions needed to create and maintain bookings.
3. For **Manager**, allow management-level access to booking records.
4. For **Housekeeping**, give only the form/fields required for housekeeping operations if your design exposes them.
5. For **Finance**, restrict access to only the booking/payment information required for billing.
6. For **Marketing**, avoid unnecessary edit/delete access to booking records.
7. Save the permissions and test each role.

Follow the principle of least privilege: give each role only the access required for its job.

7. Configure Report Permissions

1. Open the access settings for **Room_Booking_Report** and the other booking reports.
2. Give **Front Office** access to operational booking reports.
3. Give **Manager** access to all management reports needed for monitoring.
4. Give **Housekeeping** access to arrival/room-readiness information.
5. Give **Finance** access to billing/payment-related information.
6. Give **Marketing** access to analytics such as guest-origin or summary reports.
7. Restrict delete/edit permissions where the role only needs to view information.

The previous report exercises use reports such as All_Bookings_List, Bookings_Spreadsheet, Booking_Status_Kanban, Checkin_Schedule_Calendar, Guest_Origin_Map, Booking_Activity_Timeline, RoomType_By_MealPlan_Pivot, RoomType_Popularity_Chart, and Guest_Stay_Summary.

8. Test Permissions Role-by-Role

1. Sign in using a **Front Office** test user and open the booking form/report.
2. Verify that the user can perform the intended booking operations.
3. Sign in using a **Housekeeping** test user and verify that only housekeeping-related access is available.
4. Sign in using a **Finance** test user and verify finance-related information access.
5. Sign in using a **Marketing** test user and verify analytics/report access.
6. Sign in using a **Manager** test user and verify the required management-level access.
7. Try an action that should be restricted and confirm that the role cannot perform it.

A permission assignment is not complete until it is tested from the user's actual role/account.

9. Permission Matrix for Lab Record

Component / Action	Manager	Front Office	Housekeeping	Finance	Marketing
Room_Booking_Form	Manage	Add/Edit	Limited	View	Limited
Room_Booking_Report	Manage	View/Edit	View	View	View
Booking status	Manage	Update	Relevant status	View	View
Housekeeping status	Manage	Update	Update	View	View
Analytics reports	View	View	View	View	View
Delete records	Restricted/control led	Restricted	No	No	No

This is a sample permission matrix for demonstrating the concept. If your actual Exercise 7 sheet specifies exact access levels, use those exact levels instead.

10. Screenshot Checklist

- Users list / user configuration screen
- Roles configuration screen
- Permission/access configuration for Room_Booking_Form
- Permission/access configuration for Room_Booking_Report
- Manager test result
- Front Office test result
- Housekeeping test result
- Finance test result
- Marketing test result
- One screenshot showing a restricted action being blocked

Final lab flow: Create users → create roles → assign users → configure form/report access → test each role → capture screenshots.

11. Quick Revision

User = individual account accessing the app.

Role = group representing a user's responsibility.

Permission = what the role/user is allowed to do.

Least privilege = provide only the access required for the job.

Verification = test the application from each role, not only from the administrator account.

For your Hotel Room Booking app, remember: Manager controls overall operations; Front Office handles bookings; Housekeeping handles room readiness; Finance handles billing/payment information; Marketing uses analytics.
