Dashboard – Student Management System

Department of Computer Science and Engineering
NAME: Pranav Narayanan.T
ROLL NO: 240701393

AIM

To create dashboards in Zoho Creator for a Student Management System and display useful student information, including enrollment totals, gender-based counts, and course completion status.

THEORY

A dashboard presents important application information on one screen in a concise visual format. Instead of opening multiple forms and reports, users can review key figures at a glance and understand the current state of the system.

Zoho Creator is a low-code platform for building applications backed by data. Forms store the entered information, while reports and dashboards display summaries of that data. Dashboard pages can include KPI number cards, charts, and reports. Each component is connected to a form and can use an aggregate function such as Count, along with criteria that limit which records are included. The displayed values update as the underlying records change.

In this Student Management System, the main modules are Student Profile, Course Enrollment, Guardian Contact, and Academic Record. Three dashboards—Student dashboard, Dashboard1, and Dashboard2—are used to summarize student totals, gender counts, and course completion.

PROCEDURE

1. Sign in to Zoho Creator and open the Student Management System application.

2. Confirm that the Student Profile, Course Enrollment, Guardian Contact, and Academic Record forms are available, and add sample records.

3. Create a dashboard named Student dashboard and add number (KPI) cards for enrolled students and female students.

4. Select the appropriate source form, set the aggregate function to Count, and apply a Gender = Female criterion where required.

5. Create Dashboard1 and configure a Male Count card using the criterion Gender = Male.

6. Create Dashboard2 and add two Course Completion by Department components to count completed and incompleted courses.

7. Save the dashboards and ensure they appear in the application menu.

8. Open each dashboard and verify the displayed totals against the stored records.

OUTPUT

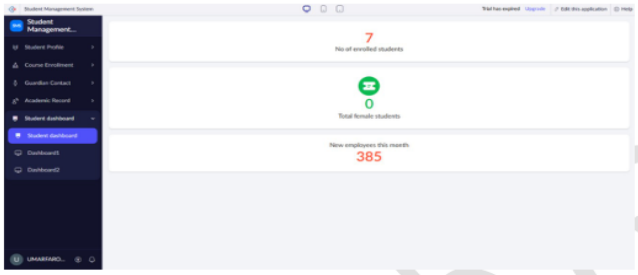

Output 1: Student dashboard

The main dashboard contains three summary cards. The reference shows 7 enrolled students, 0 female students, and a third card labelled “New employees this month” with a value of 385.

OUTPUT:

Output 1: Student dashboard

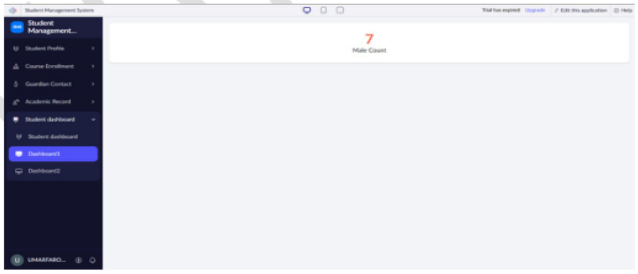

The Student dashboard is the main page of this section. It is built from summary cards, where each card shows one number calculated from the stored data. A card is linked to a form, uses the Count function and may apply a criteria, so the value it shows always reflects the latest records.

This dashboard shows three summary cards. The first card displays 7 as the number of enrolled students, and the second card displays 0 as the total number of female students. A third card, labelled "New employees this month", displays 385. These cards give the administrator the overall student strength in a single view.

Output 2: Dashboard1

A dashboard component can be restricted with a criteria so that it counts only the records that match a given condition. In this dashboard a criteria on the gender field is applied, so the card counts only the male students instead of all the students.

Dashboard1 displays the Male Count as 7. Since the number of enrolled students is also 7 and the number of female students is 0, the figures of the two dashboards are consistent with each other, which confirms that the criteria are working correctly.

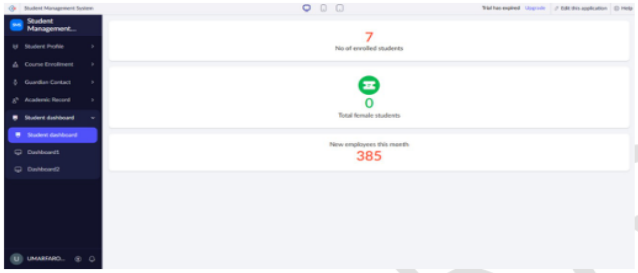

Output 2: Dashboard1

Dashboard1 applies a gender criterion and displays Male Count = 7. This agrees with the total enrollment count of 7 and female count of 0 shown in the main dashboard.

OUTPUT:

Output 1: Student dashboard

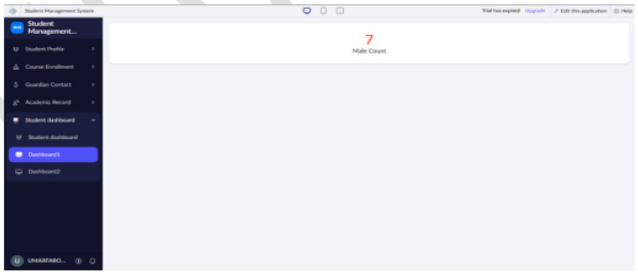

The Student dashboard is the main page of this section. It is built from summary cards, where each card shows one number calculated from the stored data. A card is linked to a form, uses the Count function and may apply a criteria, so the value it shows always reflects the latest records.

This dashboard shows three summary cards. The first card displays 7 as the number of enrolled students, and the second card displays 0 as the total number of female students. A third card, labelled "New employees this month", displays 385. These cards give the administrator the overall student strength in a single view.

Output 2: Dashboard1

A dashboard component can be restricted with a criteria so that it counts only the records that match a given condition. In this dashboard a criteria on the gender field is applied, so the card counts only the male students instead of all the students.

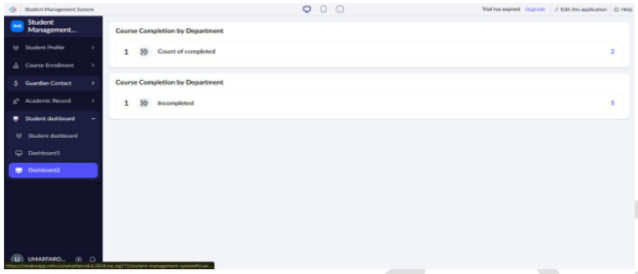

Dashboard1 displays the Male Count as 7. Since the number of enrolled students is also 7 and the number of female students is 0, the figures of the two dashboards are consistent with each other, which confirms that the criteria are working correctly.

Output 3: Dashboard2

Dashboard2 contains two components titled Course Completion by Department. The reference shows 2 completed courses and 5 incompleted courses, which together account for all 7 enrolled students.

Output 3: Dashboard2

Dashboards are also used to track the status of a process. Here the course status of the students is grouped and counted, which helps the administrators to see how many students have completed their courses and how many have not, without opening the individual academic records.

Dashboard2 shows two components titled Course Completion by Department. The count of completed courses is 2 and the count of incompleted courses is 5. Together they give 7, which is equal to the number of enrolled students, so every student is accounted for in the completion summary.

RESULT:

Thus, the dashboards for the Student Management System were successfully created in Zoho Creator, and the enrolled student count, gender-wise count and course completion summary were displayed and verified.

RESULT

Thus, the Student Management System dashboards were created in Zoho Creator to present enrollment totals, gender-wise counts, and course completion status. The values shown in the reference dashboards were checked for consistency.
