

Hotel Booking Automation Suite

Zoho Creator — Step-by-Step Implementation Guide

Assignment 03: Workflow Options Use Case

This guide converts the uploaded assignment into a practical click-by-click build plan for the existing **Hotel Room Booking & Front Office Management** application.

It covers all eight required workflow options: Form Workflows, Schedules, Approvals, Payments, Blueprints, Batch Workflows, Report Workflows, and Functions.

Base components: Room_Booking_Form and Room_Booking_Report

Important: Zoho Creator's exact button labels/layout can vary slightly by Creator version. Use the current Workflow section in your app and match the workflow names and logic from the assignment.

Prepared as a lab-record implementation reference

1. Real Zoho Creator UI Examples

The following are real Zoho Creator application screens available from the working project context. They are included to help you recognize the Creator interface while building the workflows.

Example A — Creator application/home screen

Use this general app/editing area as the starting point before opening Workflow.

Example B — Report screen

This is the type of report area used by the assignment for Room_Booking_Report and for the report workflow.

2. More Real Creator Screens

Example C — Form builder / form configuration

The screenshot shows the 'Room_Booking_Form' configuration screen in Zoho Creator. The left sidebar contains a navigation menu with options: Home, All Lead Kanban, All Sales View, Add New Lead, Room_Booking_Form (selected), and Room_Booking_Form Report. The main area displays the form fields for 'Room_Booking_Form'. The fields are: Guest_name* (First Name, Last Name), Email_address*, Permanent Address (Address Line 1, Address Line 2), City / District, State / Province, Postal Code, Country, Contact_Number (+91, 81234 56789), ID_Proof_Number, and Special_Requests.

Your Room_Booking_Form is the main source form for the form workflow, schedule-related data, approvals, and payment flow.

Example D — Application page/dashboard area

The visual layout is useful for recognizing the Creator editing environment. The workflow builder is opened from the application's Workflow area.

Tip: These screenshots are interface references; your own final lab screenshots should show the eight workflow configurations in your own Hotel Room Booking app.

3. Assignment Workflow Map

The assignment requires eight automations layered on the existing booking process, with guests receiving automated communication and Front Office, Manager, and Finance handling the operational checkpoints.

#	Workflow option	Required workflow name	Main trigger
1	Form Workflows	On_Booking_Submit_Workflow	Room_Booking_Form submission
2	Schedules	Daily_Checkin_Reminder_Schedule	Daily, 6:00 PM
3	Approvals	Complimentary_Upgrade_Approval	Upgrade/discount flagged
4	Payments	Booking_Advance_Payment_Workflow	After booking submission
5	Blueprints	Booking_Lifecycle_Blueprint	Booking status lifecycle
6	Batch Workflows	Bulk_Feedback_Request_Batch	Nightly, 11:00 PM
7	Report Workflows	OnEdit_Recalculate_Balance_Workflow	Report record edit
8	Functions	Generate_Invoice_Function	Checked-Out / manual resend

The uploaded assignment explicitly maps the eight workflow options to the Room_Booking_Form/Report and requires all eight to be built.

4. Form Workflow — On_Booking_Submit_Workflow

Purpose: Send an instant booking confirmation to the guest and notify the front office when a new booking is submitted.

1. Open the Hotel Room Booking app in edit mode.
2. Open the **Workflow** section and choose the option for a **form workflow**.
3. Select **Room_Booking_Form**.
4. Choose the record event for a new record / addition and the form event for submission/success, according to the current Creator UI.
5. Name it **On_Booking_Submit_Workflow** and create it.
6. In the workflow builder, add an email/notification action for the guest.
7. Add a second notification action for the front office.
8. Include the Booking ID and stay details in the guest message, then save and test with a sample booking.

Configuration to match the assignment

- The assignment says this workflow fires when a new record is added to Room_Booking_Form.
- Guest email should contain Booking ID and stay details.
- Front office should be notified for room allocation.
- Invalid guest email should fail gracefully and log an error rather than blocking the booking.

Lab screenshot to capture: Show the Workflow Builder with the event and the email/notification actions visible.

5. Schedule — Daily_Checkin_Reminder_Schedule

Purpose: Every day at 6:00 PM, find guests checking in the next day and send pre-arrival instructions.

1. Open **Workflow** → **Schedules**.
2. Create a new schedule workflow.
3. Select the booking form/data source required by the current Creator schedule interface.
4. Set the schedule to run **daily at 6:00 PM**.
5. Name it **Daily_Checkin_Reminder_Schedule**.
6. Add a Deluge/data action that selects records whose **Check_In_Date** is tomorrow.
7. Add the email action containing directions and check-in instructions.
8. Save and enable the schedule.

Configuration to match the assignment

- The assignment specifies 6:00 PM daily, all year round.
- Only guests checking in tomorrow should receive the reminder.
- Only one reminder should be sent per booking.
- Include directions and configured pre-arrival instructions.

Lab screenshot to capture: Show the schedule settings and the workflow builder action that sends the reminder email.

6. Approval — Complimentary_Upgrade_Approval

Purpose: Route complimentary upgrades or special discounts to the manager before they are applied.

1. Open **Workflow** → **Approvals** and create a new approval workflow.
2. Select the relevant booking form and name it **Complimentary_Upgrade_Approval**.
3. Set the criteria so the approval is used only when an upgrade or special discount is requested.
4. Choose the approver role **Duty Manager**.
5. Add the approval action and define what happens on approval.
6. Add the rejection/denial action and keep the upgrade/discount unapplied when rejected.
7. Save and test using a booking marked for upgrade or special discount.

Configuration to match the assignment

- Standard bookings bypass this approval.
- The manager must approve before the upgrade or discount is applied to the guest folio.
- Use one primary approver role with a fallback approver.
- Capture a screenshot of the approval workflow builder and approver settings.

Lab screenshot to capture: Show the approver, criteria, and approval/rejection actions.

7. Payment — Booking_Advance_Payment_Workflow

Purpose: Generate an advance-payment link, collect payment through the configured gateway, and update payment status automatically.

1. Open **Workflow** → **Payments**.
2. Create a payment workflow for the booking process and name it **Booking_Advance_Payment_Workflow**.
3. Configure the payment gateway/connector available in your Creator environment.
4. Set the advance amount/percentage used for the booking.
5. Configure the success path to update **Advance_Payment_Status** to Paid and store the transaction reference.
6. Configure the failure path to flag the booking for front-office follow-up.
7. Save and test with a sample transaction.

Configuration to match the assignment

- The assignment requires the payment flow immediately after form submission and before the confirmation email.
- Successful payment updates Advance_Payment_Status to Paid.
- Failed payment must be flagged for front-office follow-up.
- The assignment expects retry of the payment callback status check up to 3 times.

Lab screenshot to capture: Show the payment workflow configuration and, if available, a test payment link/status result.

8. Blueprint — Booking_Lifecycle_Blueprint

Purpose: Control the booking lifecycle through role-based stages and transitions.

1. Open **Workflow** → **Blueprints** and create a new blueprint.
2. Associate it with the booking form/report data.
3. Name it **Booking_Lifecycle_Blueprint**.
4. Create the four stages: **Enquiry** → **Confirmed** → **Checked-In** → **Checked-Out**.
5. Create transitions between each stage.
6. Assign transition permissions to the appropriate roles.
7. Add a mandatory comment field to every stage transition.
8. Save and test the visual blueprint with a sample booking.

Configuration to match the assignment

- Each transition must be role-restricted.
- A booking cannot skip the intermediate stages.
- The manager must be able to see an auditable trail showing when and by whom each transition happened.
- Every transition requires a mandatory comment.

Lab screenshot to capture: Capture the Blueprint visual stage diagram and the transition-permission configuration.

9. Batch Workflow — Bulk_Feedback_Request_Batch

Purpose: Send feedback survey links to checked-out guests in controlled batches.

1. Open **Workflow** → **Batch Workflows**.
2. Create a new batch workflow for the booking form.
3. Choose the scheduled execution option.
4. Set it to run every night at **11:00 PM**.
5. Name it **Bulk_Feedback_Request_Batch**.
6. Set the selection criteria for guests who checked out that day / within the required 24-hour window.
7. Set the batch size to **100 records**.
8. Add the Deluge action to send the feedback survey link and save.

Configuration to match the assignment

- The assignment specifies batches of 100.
- The purpose is to avoid processing all checkout records at once.
- The batch should run automatically at 11:00 PM.
- Execution status and failures can be checked in application logs.

Lab screenshot to capture: Show the batch schedule, batch size/criteria, and the action inside the batch builder.

10. Report Workflow — OnEdit_Recalculate_Balance_Workflow

Purpose: Recalculate Total_Amount_Payable when front-office staff edit room tariff or discount directly in the report.

1. Open **Workflow** → **Report Workflows** in the current Creator interface.
2. Select **Room_Booking_Report**.
3. Create/name the workflow **OnEdit_Recalculate_Balance_Workflow**.
4. Configure it to react to an edit made in the report.
5. Restrict the action so it runs only when **Room Tariff** or **Discount** changes.
6. Recalculate **Total_Amount_Payable** using the required business formula.
7. Save, edit a test record in the report, and verify the total updates.

Configuration to match the assignment

- The assignment specifically says the workflow is triggered by edits inside Room_Booking_Report.
- It should not recalculate for unrelated edits.
- Its purpose is to prevent inconsistent billing after manual overrides.

Lab screenshot to capture: Show the report workflow configuration and a before/after record showing the recalculated payable amount.

11. Function — Generate_Invoice_Function

Purpose: Create reusable Deluge logic that generates the final stay invoice PDF and emails it to the guest.

1. Open the application's **Functions** area and create a reusable function.
2. Name it **Generate_Invoice_Function**.
3. Add input validation for Guest Name and Email.
4. Write the Deluge logic to calculate room charges, taxes, and add-ons, generate the invoice PDF, and email it.
5. Call the function automatically when a booking changes to **Checked-Out**.
6. Add a manual **Resend Invoice** button that calls the same function.
7. Optionally call the same function from a batch/monthly accounting process.
8. Save and test both automatic and manual invocation.

Configuration to match the assignment

- The assignment requires reusable logic rather than duplicating invoice code across workflows.
- It should generate the final invoice PDF and email it to the guest.
- It must fail safely if Guest Name or Email is missing.
- Evidence must show the function being called from at least two workflow types.

Lab screenshot to capture: Capture the Deluge script and screenshots proving at least two different callers.

12. End-to-End Test Flow & Submission Checklist

Test the full lifecycle in this order:

1. Submit a new Room_Booking_Form record → confirmation workflow fires.
2. Advance payment link is generated → payment status becomes Paid/failed.
3. If upgrade/discount is requested → manager approval is required.
4. Move the booking through Enquiry → Confirmed → Checked-In → Checked-Out using the Blueprint.
5. At 6:00 PM → tomorrow's arrivals receive reminders.
6. Edit tariff/discount in the report → payable amount recalculates.
7. At 11:00 PM → checked-out guests are processed in feedback batches.
8. At Checked-Out → invoice function generates/emails the invoice; Resend Invoice can call it again.

Required screenshots from the assignment

- Each workflow's configuration screen in Workflow Builder.
- Blueprint visual stage diagram with transition permissions.
- Sample confirmation email and payment link triggered end-to-end.
- Generate_Invoice_Function Deluge script plus evidence it is called from at least two workflow types.

The uploaded assignment lists these four screenshot deliverables on page 6. [filecite turn6file0 L278-L285](#)

Governance checks

- Invalid guest email: fail gracefully and log the error.
- Reminder schedule: only one reminder per booking.
- Approval: Duty Manager + fallback approver.
- Payment callback: retry status check up to 3 times.
- Blueprint: mandatory transition comment.
- Batch: default batch size 100.
- Report workflow: trigger only when Room Tariff or Discount changes.
- Function: validate Guest Name and Email before invoice generation.

These governance rules are specified in the assignment. [filecite turn6file0 L224-L243](#)
